IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicant:

McGarry et al.

Title:

PRINTING SYSTEM

Appl. No.:

10/699,893

Filing Date:

11/3/2003

Examiner:

Nguyen, Thinh H.

Art Unit:

2861

DECLARATION UNDER 37 C.F.R. 1.131

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

We, Mark McGarry, Robert Fogarty, Josep-Maria Serra, Ronald D. Stephens, and Kurt Thiessen, state and declare that:

- Each of us is an inventor of at least one of originally filed Claims 1
 through 65 of U.S. Patent Application Serial No. 10/699,893, filed on 11/3/2003, and entitled "Printing System."
- 2. We understand that in an Office Action dated February 22, 2006, claims 1-5, 17-18, 40-44, 50, and 59 of the 10/699,893 patent application were rejected as being anticipated based on European Patent Application EP1329322.
- 3. We understand, based on the information provided on the front page of European Patent Application EP1329322, that European Patent Application EP1329322 was published on July 23, 2003.

4. Prior to July 23, 2003, we conceived in the United States the invention described in claims 1-5, 17-18, 40-44, 50, and 59 of the above-referenced Application as evidenced by the attached Exhibit A.

HEWLETT PACKARD

- 5. Exhibit A is a redacted copy of an invention disclosure which was written and dated prior to July 23, 2003. Exhibit A generally describes a printhead brick assembly.
- Exhibit B is a redacted copy of an invention disclosure which was written and dated prior to July 23, 2003. Exhibit B generally describes an ink delivery system.
- Exhibit C is a redacted copy of an invention disclosure which was
 written and dated prior to July 23, 2003. Exhibit C generally describes an umbilical.

Ally. Dkl. No. 200310932-1

We hereby declare that all statements made herein of our own knowledge are true, and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code. and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

General Information

Title printhead brick assembly

Abstract The present invention includes a housing, a plurality of printheads and stalls, and a tubing assembly, printhead cable assembly, pen driver pca, electrical connector, and manifold assembly. An operator inserts a printhead into each stall, mates the printhead brick assembly to an umbilical, and initiales printing.

FIG describing invention (Uploaded by

Description of Invention

Problems Solved Problem: SPS OEM partners find it exceedingly difficult to Integrate HP TIJ technology into their printing systems.

> Problem: apparatus for quickly and easily switching links on a printer does not exist. The present invention provides apparatus which allows end users to avoid costly downtime associated with flushing/purging old ink and replacing it with a new type of ink (prior method).

Problem: HP must disclose an unacceptable amount of intellectual property to OEM partiers when integrating TIJ into their printers.

Problem: HP technical support of piece/part product offerings and reference designs is exceedingly difficult (during both product development AND mature support of HP products in OEM printing systems)

Problem: SPS cannot scale their business quickly enough using the current product offering.

Prior Solutions SPS has previously offered component-level piece parts and reference designs to OEM partners for integration of TiJ into their printers. Unfortunately, SPS and OEM partners have found this approach requires an unacceptable amount of rescurces to implement successfully. Furthermore, HP had to disclose an unacceptable amount of HP intellectual property for a successful implementation. This has prevented SPS from scaling their business since a finite number of implementations can be done using finite SPS resources. This approach does not allow for quick and easy changeover of ink type, i.e., OEM printers have ink tubing dedicated to one particular ink type.

Description

Please refer to the attached figure. The present invention includes a housing, a plurality of printheads and stalls, and a tubing assembly, printhead cable assembly, pen driver pca, electrical connector, and manifold assembly.

HEWLETT PACKARD

The tubing assembly includes ink tubing, a plurality of septum housings, and a needle. The septum housings are mechanically keyed such that they receive only a particular printhead having a particular link type. The needle is mechanically keyed such that it fits into only one of the plurality of septum housings on the manifold assembly. This prevents unintentional mixing of different ink types.

The printhead cable assembly provides electrical communication between each printhead and the pen driver pca.

The manifold assembly includes a plurality of septum housings attached to a manifold block. Each septum housing is mechanically keyed such that they each receive a particular needle. This prevents unintentional mixing of different link types.

Each printhead is replaceably positioned in a printhead stall. Each septum housing is replaceably attached to a printhead stall, and the needle is replaceably attached to a predetermined manifold septum housing to allow fluidic communication between each printhead and the manifold assembly.

The electrical connector is electronically coupled to the pen driver pca and mounts to the housing. Each stall mechanically attaches to the housing. The manifold block attaches to the housing.

The electrical connector and manifold assembly interface directly with mating components on an umbilical (refer to invention disclosure 6KSZ).

The plurality of printheads are arranged in a particular staggered configuration to achieve a particular print swalh and printing speed (throughput). Many other staggered configurations would be obvious to one of skill in the art.

An operator inserts a printhead into each stall, mates the printhead brick assembly to an umbilical, and initiates printing.

Advantages The present Invention allows OEM painters to more quickly and easily integrate HP TiJ technology into their printing systems. The present invention reduces time to market by reducing product development efforts of OEM partner and SPS.

> The present invention reduces exposure of HP intellectual property to OEM parnters when Integrating TIJ into their printers.

The present invention allows more efficient HP technical support during both product development AND mature support of HP products in OEM printing systems.

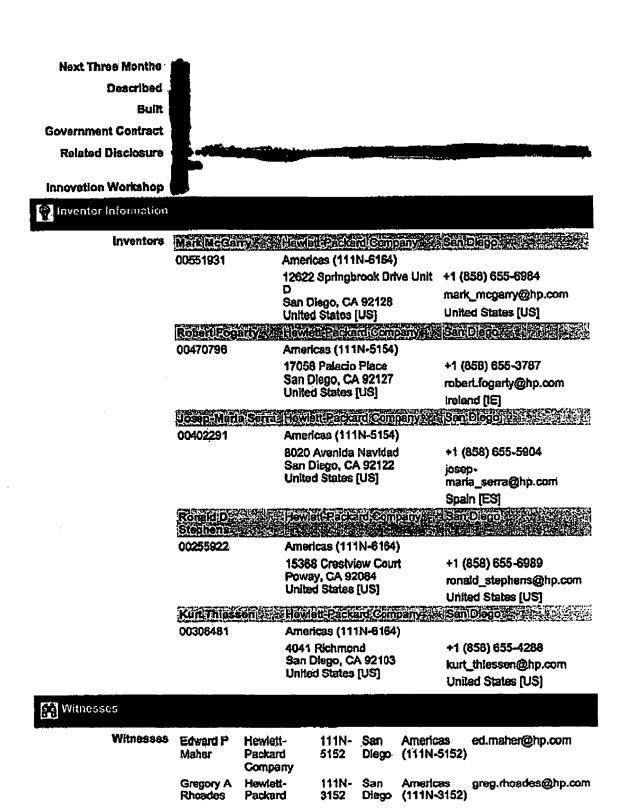

The present invention provides apparatus which allows end users to avoid costly downtime associated with flushing/purging old ink and replacing it with a new type of lnk.

Consequently, the present invention will allow SPS to more quickly scale their husinegg

Title ink delivery system

Abstract The present invention is an ink delivery system including a housing, an ink pressurization system, electronical control system, and an external mechanical, electrical, and fluidic interface, a plurality of pairs of ink cartridges, each pair connected to a hot swap valve. The electrical control system controls the ink pressurization system, communicates with ink cartridge acumen, and communicates with a remote printing control system (not shown). The electronical control system also monitors the link level in each ink cartridge via ILS directly and automatically switches a hot swap valve to direct ink from an empty ink cartridge to a full ink cartridge.

Description of Invention

Problems Solved Problem: A totally self-contained ink delivery system having hot-swapable ink cartridges does not exist. Consequently, it is difficult for SPS OEM partners to integrate off-axis ink delivery systems into their printers.

Prior Solutions Existing ink delivery systems are not totally self contained and do not allow hotswapping of ink cartridges. Existing product offering from SPS to OEM partners includes components and reference design only, as opposed to the fully integrated system of the present invention.

Description

Refer to figure. The present Invention is an ink delivery system including a housing, an ink pressurization system, electronical control system, and an external mechanical, electrical, and fluidic interface, a plurality of pairs of ink cartridges, each pair connected to a hot swap valve.

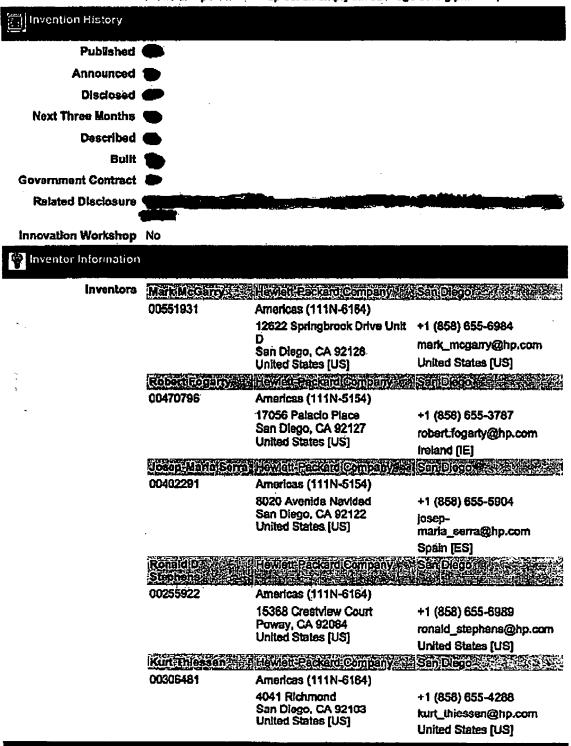

The electrical control system controls the ink pressurization system, communicates with Ink cartridge acumen, and communicates with a remote printing control system (not shown).

The electronical control system also monitors the ink level in each ink cartridge via ILS circultry and automatically switches a hot swap valve to direct ink from an empty ink cartridge to a full ink cartridge.

Advantages The present invention allows SPS OEM partners to quickly and easily integrate an lnk delivery system into their printer.

> The hot-swapping functionally prevents the printing system from automatically shutting down due to out of ink conditions and prevents dry-firing of nozzles and

allows an operator to swap out an empty ink cartridge during printer operation.

General Information

Title ubmilical

Abstract The present invention includes a condult, a first interface block, a second interface block, and a third interface block. The conduit includes a first end and a second end. The first interface block includes a first mounting plate, a first plurality of ink septum and a first electrical connector. The second interface block includes a second mounting plate and a second plurality of ink septum. The third interface block includes a third mounting plate and a second electrical connector. The first interface block is connected to the first end, the second interface block is connected to the second end, and the third interface block is connected to the second end. The first plurality of ink septum is connected to the second plurality of ink septum via ink tubing. Each tube carries a different type of ink. The first electrical connector is connected to the second electrical connector via electrical cable. The first interace block is intended for Interfacing with a mating interface block on a printhead brick assembly. The second interface block is intended for interfacing with a mating interface block on an Ink delivery system. The third interface block is intended for interfacing with a mating interface block on a printhead controller.

閟 umblical_fig.ppt -4 - Figure describing present invention (Uploaded by Mark McGarry)

Description of Invention

Problems Solved Problem 1: Apparatus for quickly and easily (i.e. SIMPLEI) interfacing electical signals and a plurality of links between a printhead brick assembly (refer to related Invention disclosure 6KSW) and an ink delivery system (refer to related invention disclosure 6KSY) and a printhead controller does not exist. Separate electrical cables and ink tubes are currently required for each printhead. Consequently, it would be exceedingly combersome and difficult for SPS OEM partners to provide such an interface.

> Problem 2: Apparatus for quickly and easily switching inks on a printer does not exist. The present invention provides apparatus which allows end users to avoid costly downtime associated with flushing/purging old ink and replacing it with a new type of ink (prior method).

Prior Solutions Existing ink tubing between the ink cartridges and printheads is dedicated to a single ink. This makes it very difficult for an operator/technician to switch inks in the printer. This usually requires flushing/purging of the old link and priming the system with the new type of ink. This process is costly, time consuming

P.21/24

(unacceptable downtime), and messy.

HEWLETT PACKARD

ink tubing and electrical cabling are currently connected separately to the printhead assembly. This approach is combersome, e.g., too many separate cables.

Description Please refer to the attached figure. The present invention includes a conduit, a first interface block, a second interface block, and a third interface block. The conduit includes a first end and a second end. The first interface block includes a first mounting plate, a first plurality of ink septum and a first electrical connector. The second interface block includes a second mounting plate and a second plurality of ink septum. The third interface block includes a third mounting plate and a second electrical connector. The first interface block is connected to the first end, the second interface block is connected to the second end, and the third interface block is connected to the second end. The first plurality of ink septum is connected to the second plurality of lnk septum via lnk tubing. Each tube carries a different type of ink. The first electrical connector is connected to the second electrical connector via electrical cable. The first interace block is intended for interfacing with a mating interface block on a printhead brick assembly. The second interface block is intended for interfacing with a mating interface block on an ink delivery system. The third interface block is intended for interfacing with a mating interface block on a printhead controller.

Advantages

The present invention provides a simple interface for electical signals and a plurality of inks between a printhead brick assembly and an ink delivery system and a printhead controller. Consequently, system integration time for OEM partners decreases significantly.

The present invetion allows quick, easy, and clean changeover to a new ink with insignificant downtime. No purging/flushing and priming required.

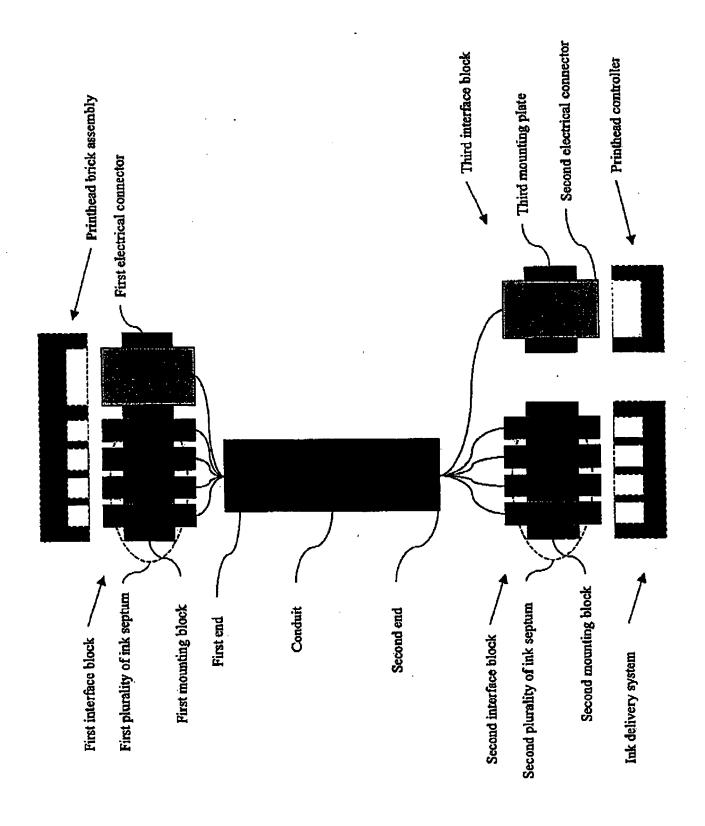

Furthermore, the present invention allows quick and easy troubleshooting of the fluidic and electrical interconnect between a printhead brick and the associated link delivery system and printhead controller. A technician can simply replace the entire umbilical as a troubleshooting technique to isolate a problem.
